four, three between five and seven, two between seven and ten, and the other two between ten and twelve. The little girl could not as yet walk alone. The two youngest boys could, although occasionally they still suckled at their mother's breasts.

The Trumaí infant was subjected to very little training. Rarely was the very young child told not to do anything. However, all the children except for Katsits, the infant girl, knew that they should defecate in the bush and urinate away from the village plaza. Katsits very often eliminated in the house, or while she was in her mother's arms. X'utsi, the mother, merely scraped a bit of dirt over the wet spot. She gave no indication to the child that this was an undesirable act, and the child took no note of her own activity. Exactly how a child learned to exert self-control is not clear, but it was probably by emulating older children and adults, whose toilet habits were hardly a secret.

The child suckled until it was five or six years of age, although it began to partake of the ordinary diet by the end of the first year. Yumununwa said that she suckled Tsirikoan three times a day: morning, noon, and evening. This was not a strict regimen, for the boy often crawled into her lap or straddled her waist and suckled at odd hours. Until about five years old, the child slept in the mother's hammock, or if motherless, with the father. Often it slept with the mother's breast in its mouth, and if it awoke during the night, it suckled until it fell asleep again.

The nursing of older children is a perpetuation of the infantile pattern, and it is indicative of the lack of stress on weaning. Also, because of infanticide and the low birth rate, there is little cause for sibling rivalry among the Trumaí.

Help was given the child in learning to walk and talk. The men appeared to devote more attention to this phase of upbringing than the women. Katsits was often walked about by her father, and sometimes by Maibu or other men who lived in the same house. Her father was eager to have her walk by herself so that he would not need to coach her, but nevertheless he and the other adults showed the greatest indulgence and patience in this task.

Part of the father's anxiety was doubtless due to the taboos which restricted his activity until his child had learned to walk. The most important of these was a ban on sexual intercourse. When Katsits developed colic, it was generally thought to be the outcome of coitus between the parents. Certain foods were also forbidden the father, one being seasoned fish hash, which was a great favorite. It is not known whether the mother was also required to observe food taboos.

More emphasis was placed on teaching the child to speak. The adults and older children made repeated attempts to put words into the mouths of the very young, saying the same phrases over and over again. In this

always used to treat the wounds made by scraping. Jawaku walked away in a hurt and angry mood, his body covered with blood.

A few days later, in recognition of his advancement, Jawaku made the afternoon serving of food to the assembled men, a custom associated with the *ole* (manioc) ceremony. A further sign of his new position was the drinking of an herbaceous emetic before eating the first *piquí* fruit. Only boys who had not yet had their stomachs scraped could eat *piquí* without first taking the medicine.

One important purpose of body-scraping, the Trumaí thought, was to make the boy grow and give him strength. For this reason even the adult males occasionally scraped their arms. The scars themselves were very much admired. Of still greater value was the size of the muscles of the arms, chest, shoulder, and back of the neck, which the Trumaí believed to be the result of the scraping.

Another method of inducing growth was by drinking medicines made from herbs. All of the upper Xingú peoples were said to know of these preparations. The Suyá were said to have learned to make them also, but not the Yuruna. Adults drank these medicines, but they were especially important during the final phase of the puberty rites.

The perforation of the ear lobes was a distinct and separate part of the cycle of puberty rites, and the only one in which the boys went through a prescribed phase as a group. This observance took place during the equinoctial festive period which follows the rainy season and involved intertribal participation. At the next dry season festival, Quain was told, all the boys would have their ears pierced. Jawaku's ears, however, had been pierced before, whereas Autsuki, who was older and had entered the puberty cycle earlier, had not yet had his ears perforated. Manifestly, the time of the first perforation varied.

At the first piercing the young boy added the name of his mother's father to the name of his paternal grandfather, which he had been given previously. This was also an occasion for scarifying the arms.

Quain was informed that ear-piercing was done by all the upper Xingú area tribes. The Suyá, in common with other Gê-speaking peoples, made very large, and to the Trumaí, very unsightly, perforations in the lobes. Two Trumaí men who had been Suyá captives had such perforations and also pierced lower lips. The latter condition explained satisfactorily to the Trumaí why the Suyá "cannot speak properly."

The puberty ceremonies were climaxed by a final series of tests of strength and courage: wrestling with a small anaconda, a subsequent intensive drinking of *okeie*, and further body-scraping. After this the boy was kept in seclusion until his ears were again pierced.

Both Jawaku and Autsuki were at this stage. One day a snake was located in the lagoon, and Jawaku was urged to go after it. He and Makurawa ran through the brush to the lagoon and searched for it along
